OVER 50% LOWER API COSTS.

I also found parallel work faster than solo runs.

That is my experience
building an iOS app with an
AI lead and lower-cost helpers.

Ensemble gives the lead
a team: it plans and reviews
while workers build
separate pieces.

**Why this could matter more
on larger projects →**

MORE ROOM TO DELEGATE.

On larger, well-divided projects, shared planning can support more implementation work.

1 SPREAD THE SETUP

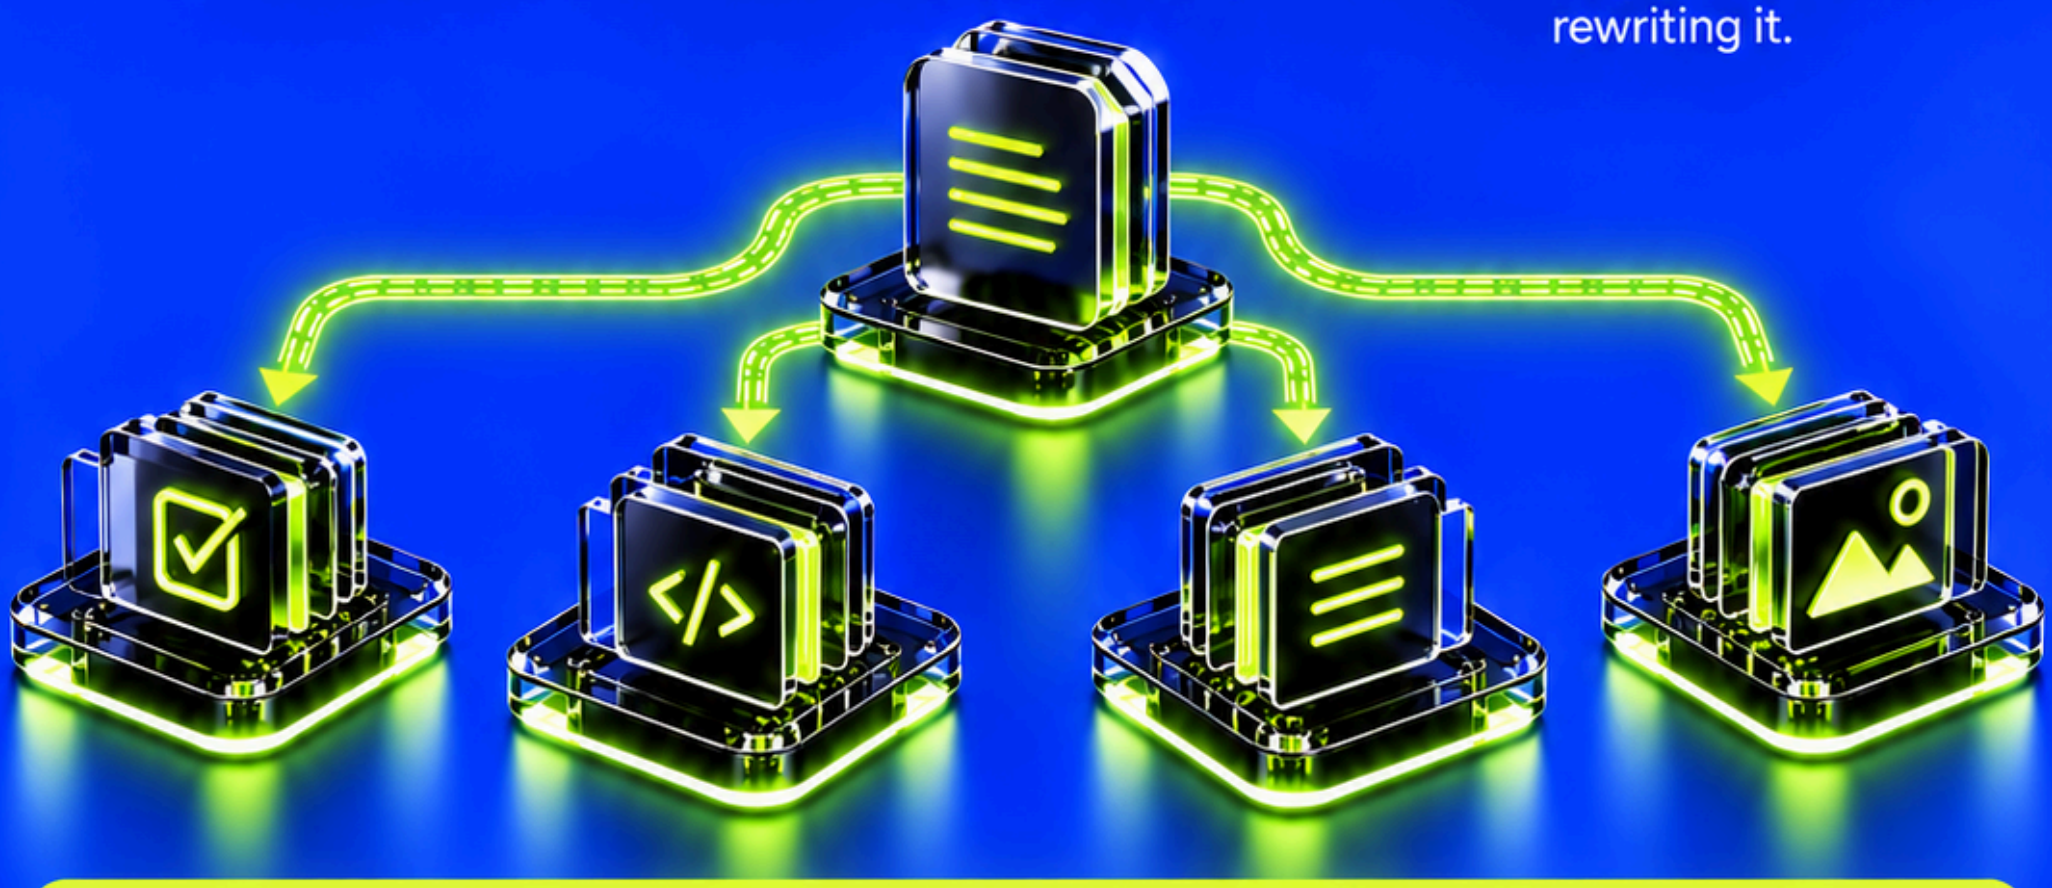

A clear brief and shared rules can guide a bigger batch of work.

2 BUILD IN PARALLEL

Independent tasks can move together, reducing time spent waiting.

3 KEEP REVIEW FOCUSED

Savings improve when the lead can check good output without rewriting it.

Project size helps only when coordination and rework stay under control.

HOW ENSEMBLE MAKES IT WORK.

One AI lead coordinates several lower-cost coding workers through an open-source tool.

1. DEFINE THE SHARED RULES

The lead sets the interfaces and divides the work before workers begin.

2. BUILD SEPARATE PIECES

Each worker gets a focused brief and assigned files. Ensemble checks where it can write.

3. REVIEW THE WHOLE RESULT

The lead reviews, integrates and verifies the output, then fixes or delegates remaining gaps.

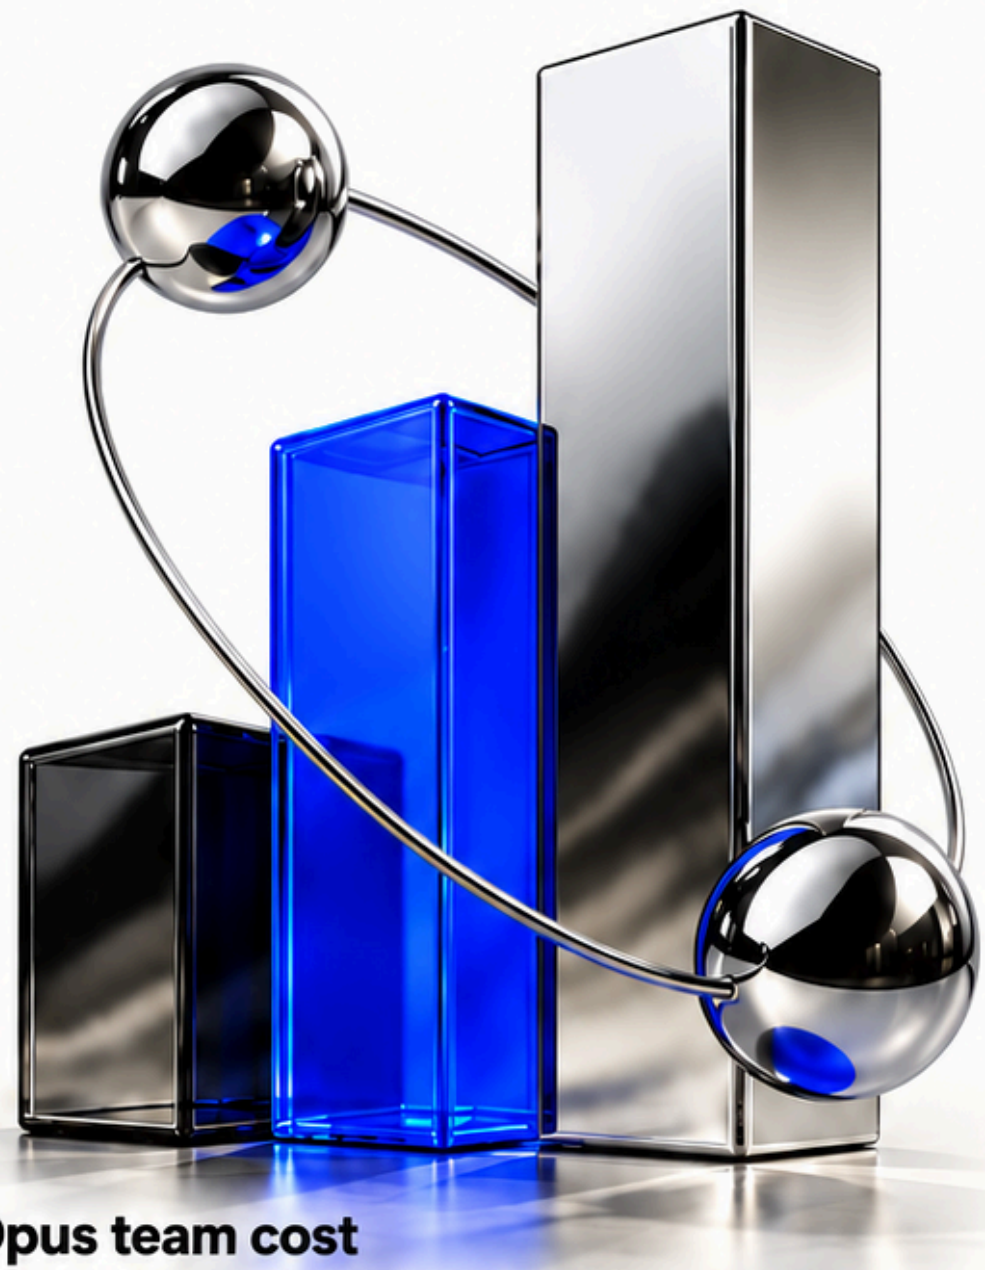

SMALL TEST. USEFUL SIGNAL.

13.9%

lower total API cost

Same small app. Three Sonnet solo runs and three team runs. Lead included.

The full team workflow took 18.1% longer.

ABOUT 88% OF THE TEAM'S API BILL STILL CAME FROM THE LEAD.

Separate pilots: 12.5% lower Opus team cost (one interrupted pair); **3.6x faster worker execution** (one earlier trial).

Choose independent tasks.
Count planning, review and repairs.
Test whether the benefit grows.

Small samples. Larger-project gains remain a hypothesis. Codex orchestration cost excluded.
